## Features

- Total integration of route management, planning, reporting, telematics, and parent apps
- Comprehensive user management capabilities
- Near real-time GPS tracking of your entire school bus fleet
- Comparative analysis of planned and actual data
- Planned and live substitution management
- View raw and processed AVL events
- Cloud-based web app: no need for district IT support of either software or hardware

**Athena Telematics** is a fully integrated GPS platform. You can manage your transportation resources with increased efficiency. You'll know with confidence where any or all of the vehicles in your fleet are at any given time. But that's just part of the story. Athena simplifies your job by providing quick access to critical details about AVL events, specific intersections, all buses serving a specific school, or user-defined searches. When you know the whole story, you can make your operation more effective and save money.

### CARES Act and ESSER Funds:

Ask your Edulog representative how to find funding that can be invested towards improving your transportation technology footprint.

## Real-Time and Historical Visibility

Display real-time GPS data as well as planned stop information from Athena Routing to quickly and easily identify if your buses are on-route, on-time, or making delayed or unscheduled stops.

## Drag-and-Drop Simplicity

Should a driver call out sick, you can easily drag and drop another vehicle onto the route to make a new assignment, keeping your records accurate and up-to-date.

## Streamline Fleet Management

When you monitor the status and activity of all your school buses, you'll be better able to respond to incidents of bad driving, reduce unnecessary dispatch communication, and improve productivity.

## Quick and Easy Implementation

Once your GPS hardware is installed on the school bus, access to real-time GPS data is available immediately. It's that simple!
